State of ABP

How the Platform is Evolving in the AI

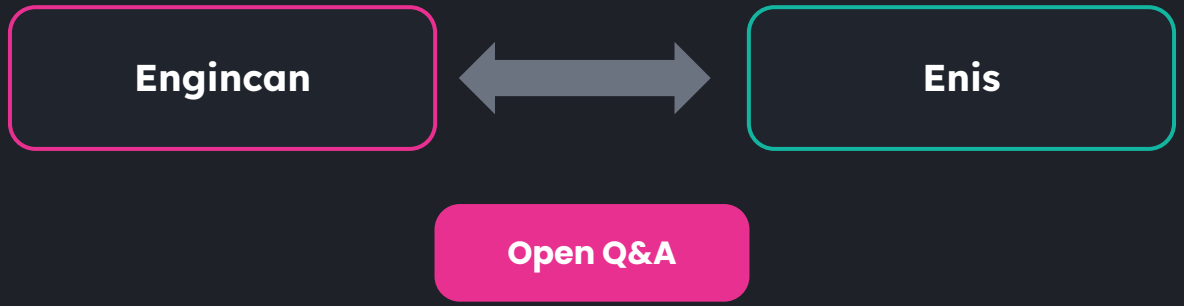

Engincan Veske & Enis Necipoğlu

Community Talks 2026.4 · Volosoft

How tonight works

AI is changing how software gets built. Tonight Enis and I step back and talk honestly about where ABP fits, and where we are taking it.

Conversation format: we trade questions as we go. Bring yours, we keep open Q&A for the end.

abp.io

Why a platform still matters in the AI era?

AI writes code fast. The real question is whether it writes the right code, in the right place, the same way every time.

A platform gives the model structure to work inside: one architecture, clear conventions, and the context it needs. That is what turns “fast” into fast, correct, and safe to ship.

Build

Modern Wizard, React UI, and an agent that knows your project.

Support

AI first, then the engineers who actually build ABP.

Learn

Free live webinars and hands-on, practical trainings.

What we have shipped lately

ABP Studio AI Coding Agent

A solution-aware agent built natively for ABP.

Modern Wizard & React UI

A simpler, AI-friendly way to start, with the new React UI.

AI Management module

RAG, MCP, and OpenAI-compatible endpoints for AI-integrated apps.

Framework & module updates

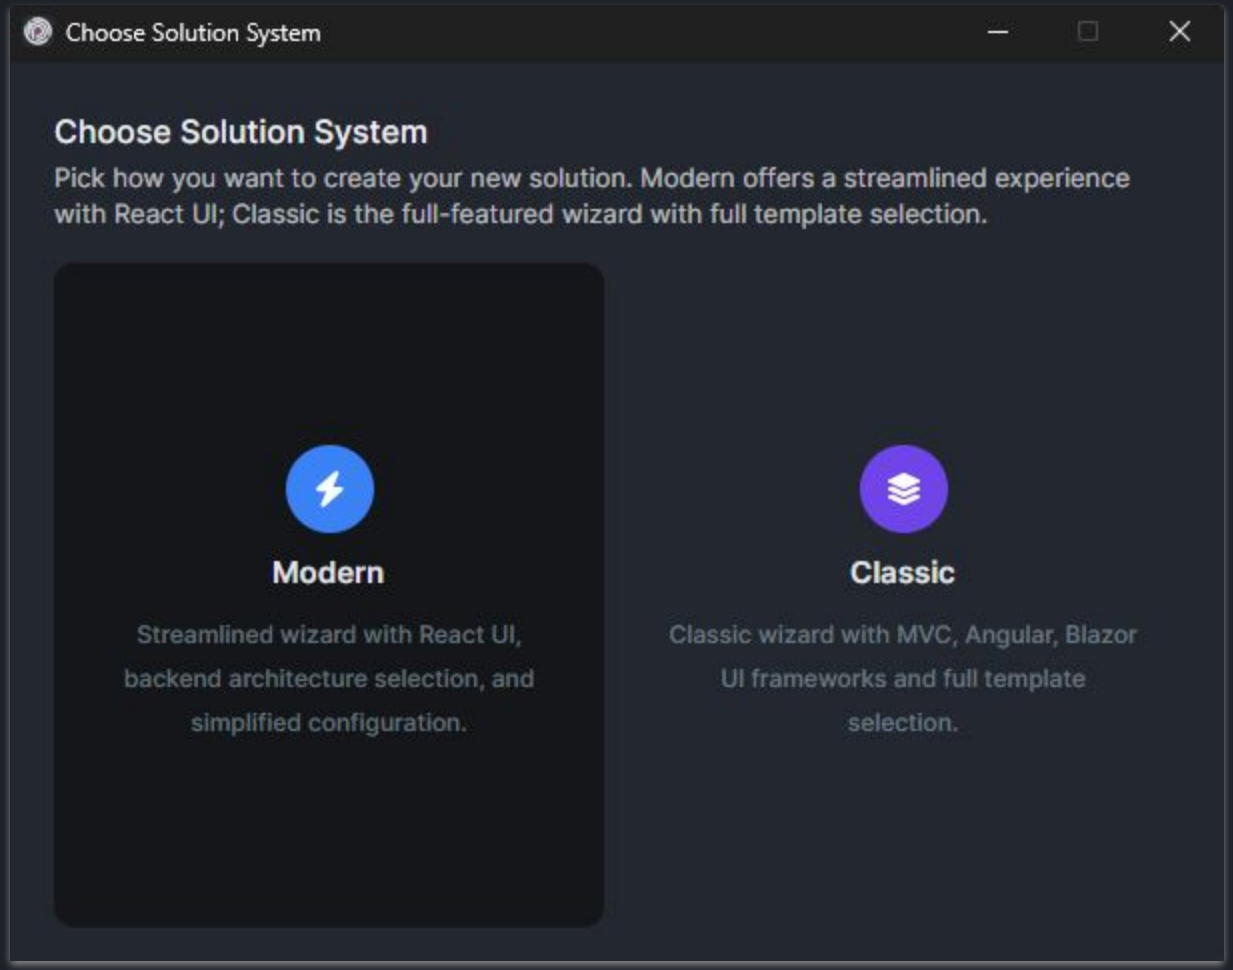

Ongoing improvements across Identity, SaaS, and more, every release...

abp.io

The Modern Wizard - React UI & the mental shift

Same ABP. A simpler, AI-friendly place to start.

abp.io

Choose Solution System
Choose Solution System
Pick how you want to create your new solution. Modern offers a streamlined experience with React UI; Classic is the full-featured wizard with full template selection.
Modern
Streamlined wizard with React UI, backend architecture selection, and simplified configuration.
Classic
Classic wizard with MVC, Angular, Blazor UI frameworks and full template selection.

abp.io

Classic vs. Modern Wizard

Classic Wizard

- Mature, with the full set of UI options (MVC, Angular, Blazor (and variations)...)
- Battle-tested across years of real projects

Modern Wizard

- The new default starting point
- Opinionated: fewer choices, a clearer path
- React UI on a stack AI tools already know: Vite, TanStack, shadcn/ui
- Shaped for AI-assisted development

Why does React live in the Modern Wizard? Because that is where we are building the simpler, AI-first path. Classic stays as-is for existing stacks.

abp.io

Is the Classic Wizard still supported?

Yes. Classic is fully supported, and nothing you have built on it goes away.

Modern is an additional path for new, AI-first projects, not a replacement. You choose the one that fits your project.

abp.io

Why React UI, and why now

- **The stack AI tools understand best.** Vite, TanStack and shadcn/ui are everywhere in training data, so there is less custom abstraction for a model to guess at.
- **A simpler mental model.** Fewer layers between you and the UI, so a prompt lands closer to working code.
- **Familiar to the wider frontend world.** Easier to hire for, easier to extend, easier to onboard new developers.
- **The practical difference.** You describe a screen; the agent generates into a clean, conventional structure, and you review less guesswork.

The React UI stack (this is the point)

ABP 10.4 did not just add React. It chose the exact stack that AI assistants already know well.

Build & test	Vite, Vitest
Routing & data	TanStack Router, TanStack Query, Axios
UI & styling	shadcn/ui, Radix UI, Tailwind CSS
Forms & types	React Hook Form, Zod, TypeScript
Auth	OpenID Connect (OIDC)

abp.io

What you actually get

Your React app

The developer-owned SPA. Your pages and features live in react/src/pages, as real code in your solution.

ABP Admin Console

The ready-made admin UI for ABP modules (Volo.Abp.AdminConsole): users, roles, settings, tenants, all wired up.

```
abp new Acme.BookStore --template app --modern --ui-framework react
```

Or pick the Modern flow in ABP Studio's New Solution wizard (v3.0+). It preconfigures ports, OIDC clients, theme, and the React + Admin Console wiring for you.

abp.io

End-to-end support, in the AI era

Faster answers, with a real person behind them.

abp.io

How support works now: abp.io/support

1

Ask at abp.io/support

An AI assistant trained on ABP docs and source answers first, instantly, any hour.

2

Hands off to the ABP team

The same engineers who build the framework pick it up from there.

3

Consultancy & 1:1 sessions

One-on-one live support for the cases that call for it.

Is support going AI-only?

No. The AI handles the fast, common questions so the team has more time for the hard ones.

Will a real person be there?

Yes. Someone on the ABP team owns your question end to end.

abp.io

DailyTalking, a new Volosoft app

Different domain, same philosophy: build what people actually need. It is a signal of where else we are putting our energy.
